

Sixteen-Year Update on Vermont Long-term Soil Monitoring Study

Don Ross, University of Vermont

Thom Villars, USDA NRCS

Scott Bailey, USFS Northern Research Station

Angie Quintana, USFS GMNF

Jim Duncan, VT Forest Ecosystem Monitoring
Cooperative

Initial Project Goals:

1. Establish five 50 x 50 m relatively uniform plots in sites associated with the Vermont Monitoring Coop.
2. Sample plots at designated intervals: 0, 5, 10, 25, 50, 100, 150, and 200 years (with 2 other times in reserve)

Year 0 = 2002

3. Analyze initial samples to determine baseline values.
4. Archive samples for later comparisons.
5. Protect the plots for future monitoring.

5 Monitoring Sites:

- Mt. Mansfield Ranch Brook
 - northern hardwood
- Mt. Mansfield Forehead
 - high elevation spruce/fir
- Mt. Mansfield Underhill State Park
 - transitional forest
 - SCAN site
- Lye Brook “Road”
 - northern hardwood
 - SCAN site
- Lye Brook “Trail”
 - transitional forest

A satellite map showing a landscape with green hills and a network of roads. A red pin with the letter 'A' is placed near the top left. Two green triangles point to specific locations. A scale bar is in the bottom left, and the Google logo is in the bottom right.

Sampling years have been:

2002, 2007, 2012, 2017...

Sampling Protocols for 2007, 2012, 2017:

Four large sample bags collected from each soil pit:

- 1. Oi and Oe combined: Litter layer**
- 2. Oa and/or A: near-surface humified horizons**
- 3. B horizon: Top 10 cm**
- 4. Between 60-70 cm (usually is the C horizon)**

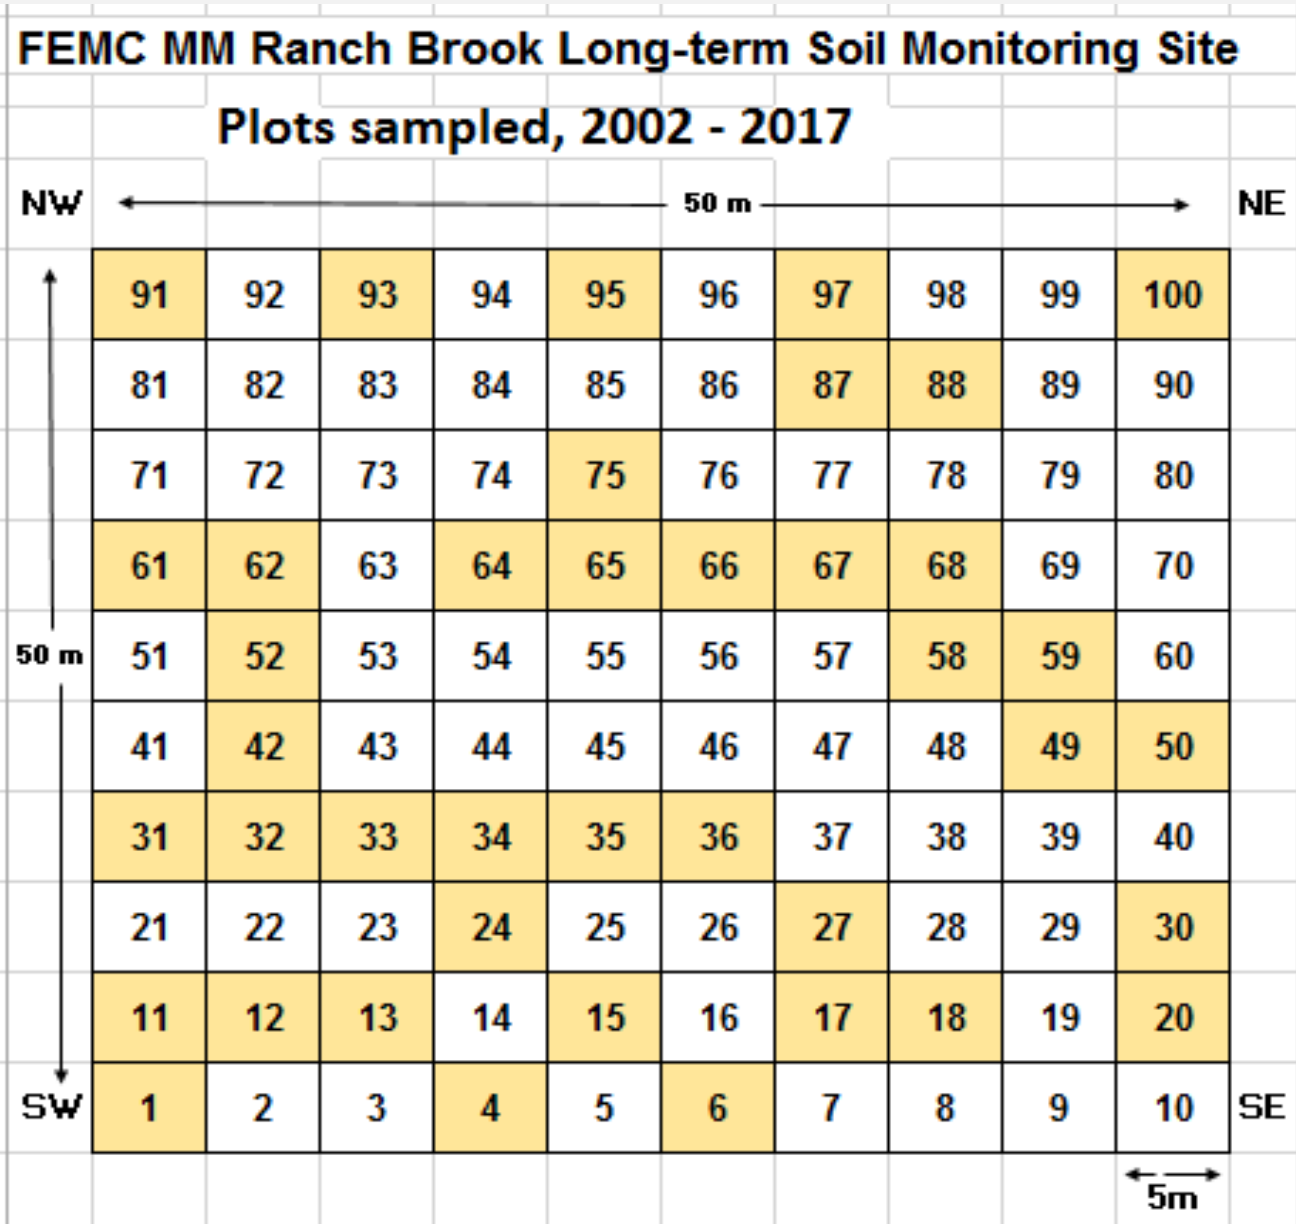

Also collected small samples of each genetic horizon.

Four bulk samples taken from each soil pit

Genetic horizons at each soil pit sampled in smaller bags

Typical site plan with 100 5x5m plots.

Plots in yellow have been sampled in 2002-2017 (40 plots to date).

Overview and experiences of the Swiss soil monitoring network over 25 years - Focus on forest soils -

André Desaules

andre.desaules@art.admin.ch

Lesson 2: Trends can be identified and certified only after sufficiently intense and long measurement series. Measurements within the noise cannot be interpreted. With increasing number of measurements and accuracy noise can be reduced and trends earlier detected. This is the foundation of pleading for increasing measurement periodicity in soil monitoring as well.

2) Increasing measuring periodicity

Extending the 5-year intervals

- Starting in 2017, each of remaining 5x5m sampling plots was subdivided into four quadrants (2.5x 2.5m).
- Plots are now located and marked by surveyors.
- This provides a possible 280 remaining subplots or 28 sampling times or 140 more years at 5-year intervals (beginning 2017).
- The 200-year study is likely now a 150-year study.

Over **1800 soil samples** have been collected since 2002 at the 5 study sites.

The last three sampling rounds have each generated over 500 unique soil samples. These are used for lab analysis and are archived at UVM.

Samples taken by genetic horizon

Horizon	2002	2007	2012	2017
Oi	-	39	50	48
Oi/Oe	-	9	-	-
Oe	-	36	48	50
Oa	49	48	48	44
A	22	21	25	30
E	30	30	32	27
B	91	129	126	118
BC	12	-	-	-
C	-	28	42	40
Total	204	340	371	357

Large samples taken by horizon or depth increment

Sample zone	2007	2012	2017
Oi/Oe	50	50	50
Oa and/or A	50	50	50
A	-	2	-
E	8	9	4
top 10 cm of B	44	46	46
60-70 cm	40	40	44
Total	192	197	194

Challenges

- Variability!
- Archiving—still nothing permanent guaranteed
- People keep retiring!
- Funding difficult
 - Some funding through the Forest Service and the FEMC

PROJECT OVERVIEW

Collect soil samples at two forested sites in Vermont. Establish permanent plot markers. Analyze soil samples and publish the results.

Objectives

Collect soil samples from long term soil monitoring sites. Detect changes in soils due to human caused impacts (i.e. climate change, air pollution, forest management) at two forested sites in Vermont.

Dataset Availability

Downloadable: 6 datasets

Description only: 4 datasets

By request: 2 datasets

**In 2017,
the FEMC (previously VMC, ...and VForEM)
Vermont Long-term Soil Monitoring Project
Steering Team is:**

- Angie Quintana, USFS Green Mountain National Forest
- Jim Duncan, VT Forest Ecosystem Monitoring Cooperative
- Deane Wang, University of Vermont **(retired June 2017)**
- Sandy Wilmot, Vermont Dept. of Forests, Parks and Recreation **(retired January 2018)**
- Thom Villars, USDA Natural Resources Conservation Service **(retiring April 2018)**
- Don Ross, University of Vermont **(definitely retiring before 2022)**
- Scott Bailey, USFS Northern Research Station **(likely retiring before 2022)**

(Almost) everyone involved in 2017:

- Sandy Wilmot, Vermont Forests, Parks and Rec
- Joshua Halman, Vermont Forests, Parks and Rec
- Isaac Estey, Vermont Forests, Parks and Rec
- Deane Wang, UVM
- Don Ross, UVM
- Emily Piersiak, UVM
- Liza Lemieux, UVM
- Jim Duncan, FEMC
- John Truong, FEMC
- Matt Gorton, FEMC
- Scott Bailey, US Forest Service, Northern Research Station
- Emily Piche, US Forest Service, Northern Research Station (now UVM)
- Angie Quintana, US Forest Service, GMNF
- Josh Lobe, US Forest Service, GMNF
- Thom Villars, NRCS-VT
- Alexis Clune, NRCS-VT
- Vermont Youth Conservation Corps (8 crew members)

**Funding generously provided by
FEMC and Green Mountain and
Finger Lakes National Forests**

**Thanks Thom!
(retirement imminent)**
